

## Flask Lap1

### Task 1: Create Your First Flask App

#### Requirements:

1. Create a file called app.py
2. Import Flask
3. Create Flask application object
4. Run the server on debug mode

### Task 2: Create Multiple Pages

Create the following routes:

/ -> Welcome Home

/about -> About Page

/contact -> Contact Page

/services -> Services Page

### Task 3: Username Route

Create dynamic route:

/user/<username>

Example:

/user/ahmed

Bonus:

Print datatype of username in terminal.

#### Task 4: Age Route

Create route:

/user/<username>/<int:age>

#### Task 5: Create Users List

```
users = [  
    {"id":1,"name":"ali","age":20},  
    {"id":2,"name":"ahmed","age":30},  
]
```

#### PART 6 —All Users

##### Task 6: /users

Display all users inside unordered list <ul>.

##### Task 7: Add New User

Create route:

/add-user/<name>

Requirements:

1. Create new user dictionary
2. Append user into users list
3. Return all users after adding

### Task 8: Delete User

Create route:

`/delete-user/<int:id>`

Requirements:

1. Search for user by id
2. Remove user from list
3. Return updated users list

### Task 9: Update User Name

Create route:

`/update-user/<int:id>/edit/<name>`

Requirements:

1. Find user by id
2. Update username
3. Return updated list

### Task 10: Render HTML File

Create folder:

`templates/`

Inside it create:

`index.html`

### Task 11: Display Users in HTML

## Task 12: User Profile

Create route:

/profile/<username>

If user found:

Render profile.html

If not found:

Render 404.html

## Task 13: Methods

GET -> Read data

POST -> Create data

PUT -> Update data

DELETE -> Delete

Create:

- Home page
- About page
- Show all users
- User profile
- 404 page
